WHIL 1999-142936/12.

Why isolated nucleic acid for, e.g. generating male sterile plants - comprises a nucleolide sequence that allows expression of a transposize gene in acarathre and sperm cells of a plant.

The present sequence encodes the LGCI protein from Lity (Lilium longillorum). The sequence specifically allows expression of the properties of a distribute cell and sperm cells of a plant. Also described arc: (1) a generative and sperm cells of a plant. Also described arc: (1) a generative and sperm cells of a plant. Also described arc: (1) a generative and sperm cells of a plant. Also described arc: (1) a generative and sperm cells of a plant. Also described arc: (1) a generative of a transposase, which is capable of inducing transposition of a transposase gene is expressed facilitating transposition of the promoter, the transposase gene is expressed facilitating transposition of the promoter, the transposase gene is expressed facilitating transposition of the product of produce a product from the plant; and (3) a male sterile plant produced by the method. The male gamete promoter and/or gene is useful for facilitating male gamete specific transposon tagged biants are used to cloue cellain gene in the produced seed content, particularly where pollination stimulates fruit development, and where the lack of fettilisation results in seedless fruit. The nucleic acids enable specific genetic manipulation of the male germ line by generating male sterile plants, and fettilitating male sterile plants, and fettilitating male sterile plants, and fettilitating male sterile plants, and results in seedless fruit. The nucleic acids enable specific genetic manipulation of the male gamete specific transposon tagging.

Nucleic acids containing electron transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single nucleotide polymorphisms, e.g. for genetyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genetyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a composition comprising two nucleic acids each contining an electron transfer group (ETM) trung different redox potentials. The invention is used for electronic detection of models especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genetyping,

Nucleic acids containing election-transfer group, useful as labels in
hybridication assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having dillerent redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     69 ttaaqcatacaacatquqqqqqqqqqqqttttctt(qcitqcqttctcttctqtatqqt 128

Nucleic acids containing electron-transfer group, useful as labels in
hybridication assays, e.g. for genetyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comparising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                                                                                                                                                                                                                                         acids each containing an electromitransfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9 atcaacaqaaqqtttnagiggaaairraitiqailagaaaqqatoqqanaaaqqqfacto 68

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acids each containing an electron-transfer group (FTM) having different redox petentials. The invention is used for eiectronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9 atcaacagaaggititaagitqqaaatncatiicattagaaaaqaatrqqaraaaayayiacir 68

The present invention relates to a composition computation tast note to acides each containing an electron-transfer uroup (EME) having did different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               109. aataqateeteacattab ayassacttaqtyasgyaasyaas aas tysettab aassas. 166

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron transfer group (ETM) having different redox potentials. The invention is used to electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nacteofide polymorphisms, e.g. for qenotyping.
                                                                                                                                                                                                                                                                                                                                      Rucleic acids containing electron (lansfer group, useful as labels in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      69 Haaawatanaanalaaapp qalaampiliii Hikritoottootti titigaaqa, 128

The sequence specifically allows expression of the queen in generative and sperm cells of a plant. Also described are: (1) a queent construct comprising a generative cell and sperm cell specific promoter operably linked to a transposase, which is capable of inducing transposition of a transposable element such that upon expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               male germ line by generating male sterile plants, and tacilitating male

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mapping of Expressed Sequence Tays from a normalized bowing mammary
                                                                                                                                                                                                                                                                                                                                                                                                              collaboration with the Entopean Drosophila Genome Postpar (FDRP) - http://www.edgp.ebi.ac.uk -. This brosophila Genome Project (FDRP) - library (Dros PAC) was made by Alain Billand at CEPH (Centre d'Frude de Folymerphisme Homain) with funding precided Ly a MEC project grant. The DNA was prepared from embryos by Alain Rocherland Genevieve Payan. It has been constructed in the vector pBeloBAC11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota, Motakoa; Chordata, Craniata, Vertebrata, Eutekeostomi,

cDNA Library Preparation: David B. Krizman, Ph.D. CDNA Library Arrayed by: I.M.A.G.E. Consortium, LLNL DNA Sequencing by: Washington University denome Sequencing Center Clone distribution: NCI-CGAP clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at:
enriched, double-stranded cDNA was digested with Not 1 and
                        clouded into the Not I and Ero RV sites of the pGMVSPORI 6 vertor. Through was naturallized. Library was shall noted by Life Technologies. Contact: Found Liang Life Perhadologies. a division of Invitroach 9800 Medical Center priva-
